Please see below for performance value definitions and page 2 for product information, recommendations and simulation conditions. Visit vitrogglazings.com for more product information.

On Cover

Fraser Tower

Product: Solarban® R100 on Optiblu®

Location: Singapore

Architect: Aurecon

Vitro Certified™ Fabricator: Wujiang Golden Glass

Glazing Contractor: YKK

Performance Values:

Color Rendering Index (CRI) – A scale from 0 to 100 percent indicating how accurate transmitted color is when viewed through the window as compared to actual color.

U-Value – A measure of the insulating characteristics of the glass or how much heat gain or loss occurs through the glass due to the difference between indoor and outdoor temperatures and is measured W/m²*K. The lower the number, the better the insulating performance. This number is the reciprocal of the R-value. Argon represents the u-value performance when the cavity is filled with a 90% argon/10% air/gas mixture. There are two methodologies used for calculations (NFRC and EN673) that utilize different solar spectrums in their calculations.

Solar Factor (SF) or g Value – The total solar energy transmittance as measured with European standards.

Solar Heat Gain Coefficient (SHGC) – Measures how well a window blocks (or shades) the heat from sunlight using NFRC methodology. SHGC is expressed as a number between 0 and 1. The lower a window's SHGC, the less solar heat it transmits and the greater the shading ability. The SHGC is similar to the Shading Coefficient (SC), but also accounts for absorbed, converted and inwardly radiated solar energy.

Shading Coefficient (SC) – Measures the total solar heat gain as compared to 3 mm glass.

Light-to-Solar Gain (LSG) – The ratio of visible light transmittance to solar heat gain coefficient.

Performance for Insulating Glass Units of 4 mm Outer Lite + 16 mm Airspace + 4 mm Inner Lite
Low-e coating showed in both #2 and #3 position

Please see page 1 for performance value definitions and below for product information, recommendations and simulation conditions. Visit vitroglazings.com for more product information.

The name of Solarban® 70XL solar control low-emissivity (low-e) glass has changed to Solarban® 70 glass, formally dropping the "XL".

Solarban® z50 glass has been changed to Solarban® 60 on Optiblue® glass. No change in performance or aesthetics.

Solarban® z75 glass has been changed to Solarban® 70 on Optiblue® glass. No change in performance or aesthetics.

Data is based on center of glass performance of representative factory production samples. Actual values may vary due to the production process and manufacturing tolerances. All tabulated data is based on NFRC methodology using the LBNL Window 7.3 software and EN 410/673 methodology using WinDat WIS version 3.0.1 software or Window 7.3 with EN spectral range modifications. This data is to be used for comparison purposes and should not be considered a contract. Simulations for laminated glass are not NFRC approved.

It is the recipient's responsibility to ensure the manufacturability of the glazing configurations as well as evaluating appropriate design considerations such as wind and snow load analysis, thermal stress analysis and local building code compliance.

Vitro recommends a full size mock-up be reviewed under the specific job-site conditions and the mock-up be retained as a basis of acceptable final product.

Important glass design considerations and comprehensive technical information, including performance, thermal stress and wind load tools for all Vitro glasses, are available at vitroglazings.com. Construct custom glass units from a virtually unlimited number of glazing configurations at construct.vitroglazings.com.
